AUSROAD[®]

JETMASTER[®] ROAD MAINTENANCE

- A** The spray bar and aggregate spreader can operate at full width (2.4 metres) or be used in any combination of eight 300mm wide gates, all controlled from the cab.
- B** Blow patching via remote controlled front boom.
- C** This process is extremely effective for heavy patching, shoulder seals, strip patching etc. Spray and cover rates are all controllable from the cab via the control system.
- D** When the full width paver bar is in use, aggregate is sprayed with emulsion as it drops to the road before being levelled off with the paver bar. This is an effective and permanent solution whenever a surface correction is required. Uses include shoulder repairs, wheel rutting etc.
